

AI Invoice & AP Automation - Invoice Data Handling

Data categories, minimization and production configuration considerations.

Typical data processed

Invoice documents and extracted fields such as supplier identity, invoice number, dates, amounts and other fields required by the customer's approval process. Approval status and operational metadata may also be recorded.

Minimization and retention

The production deployment should process only fields needed for the agreed AP workflow. Retention, deletion, access permissions and any document storage must be configured for the customer's requirements.

Limits

This document describes product controls, not a certification or accounting/legal opinion. Exact integrations and retention depend on the contracted deployment.

Document purpose: pre-engagement product transparency. This document does not represent an independent certification, legal opinion, penetration test, or guarantee of security/compliance outcomes.
