

AI Invoice & AP Automation - Security Overview

Control model for invoice intake, validation, review and approval.

Workflow boundary

Invoices enter through a configured intake channel. The system extracts structured information, validates configured rules, checks duplicate conditions and routes exceptions or approval-required items to humans.

Human approval

The product is designed so that invoice processing and approval records are automated while payment authority remains outside the AI workflow. It does not autonomously move money.

Operational safeguards

- Controlled intake
- Duplicate checks
- Validation before approval
- Human review for exceptions
- Approval/rejection recording
- SLA monitoring for pending approvals

Document purpose: pre-engagement product transparency. This document does not represent an independent certification, legal opinion, penetration test, or guarantee of security/compliance outcomes.
