

AI Lead Qualification - Security Overview

Architecture, access boundaries and operational controls.

Architecture and control boundaries

Inbound lead data enters through an approved intake source. Requests are validated before processing. Duplicate and suppression controls reduce repeated or unwanted processing.

The workflow can find or update a CRM contact, use AI to analyze intent, urgency and fit, then apply deterministic scoring and confidence rules to assign a priority band.

AI-generated customer-facing text remains a draft for human review. The current product design does not require autonomous customer sending.

Operational safeguards

- Idempotency/duplicate controls
- Suppression checks
- Deterministic scoring after AI analysis
- Manual-review fallback for low confidence or invalid model output
- Retry/error handling and CRM traceability

Customer responsibilities

The customer defines approved lead sources, CRM permissions, qualification rules, users, retention expectations and any customer-communication approval process.

Document purpose: pre-engagement product transparency. This document does not represent an independent certification, legal opinion, penetration test, or guarantee of security/compliance outcomes.
